Enrollment No: 92400133131

Aim: Practical based on File Handling using Python\

GIT HUB LINK: https://github.com/manavkasundra/PYTHON_PROGRAMMING/blob/main/lab%2013

IDE:

File handling in Python is a powerful and versatile tool that can be used to perform a wide range of operations. However, it is important to carefully consider the advantages and disadvantages of file handling when writing Python programs, to ensure that the code is secure, reliable, and performs well.

Python provides various functions to perform different file operations, a process known as File Handling.

- ***open()*** : Opens a file and returns a file object.
- ***read()*** : Reads data from a file.
- ***write()*** : Writes data to a file.
- ***close()*** : Closes the file, releasing its resources.

Opening Files in Python

In Python, we need to open a file first to perform any operations on it—we use the `open()` function Suppose we have a file named `ict.txt`

To open this file, we can use the `open()` function.

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology	
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python	

```
file1 = open("C:\\Users\\Mitesh\\OneDrive\\Desktop
\\ict.txt") or file1 = open(r"C:\Users\Mitesh\OneDrive\Desktop
\ict.txt")
```

Output:

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

```
In [3]: file1 = open(r"F:\SEMESTER\python\ict.txt")
...: print(file1)
<_io.TextIOWrapper name='F:\\SEMESTER\\python\\ict.txt' mode='r' encoding='utf-8'>
```

Working in Read mode

The open command will open the Python file in the read mode and the for loop will print each line present in the file.

```
f1 = open(r"C:\Users\Mitesh\OneDrive\Desktop \ict.txt")
# This will print every line one by one in the file
for each in f1:
    print (each) Output:
```

```
In [2]: f1 = open(r"F:\SEMESTER\python\ict.txt")
...: # This will print every line one by one in the file
...: for each in f1:
...:     print (each)
ICT ICT ICT
ICT ICT ICT ICT ICT
```

In this example, we will extract a string that contains all characters in the Python file then we can use f1.read().

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python

```
# Python code to illustrate read() mode
f1 = open(r"C:\Users\Mitesh\OneDrive\Desktop \ict.txt")
print (f1.read())
```

Example

In this example, Read a file using the with statement in Python.

```
with open(r"C:\Users\Mitesh\OneDrive\Desktop\ict.txt",'r') as f1:
    data = f1.read()
print(data)
```

Experiment No:

13 Date:11-09-2025

Enrollment No:

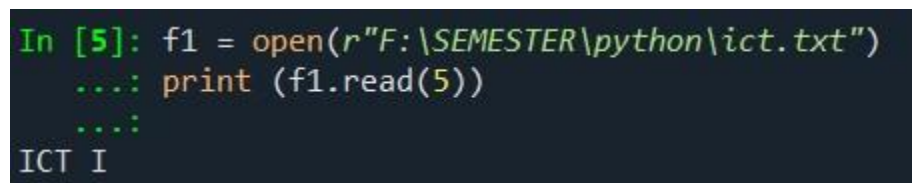

92400133057

Example 4:

Another way to read a file is to call a certain number of characters like in the following code the interpreter will read the first five characters of stored data and return it as a string:

```
f1 = open(r"C:\Users\Mitesh\OneDrive\Desktop \ict.txt")
print (f1.read(5))
```

Output:

```
In [5]: f1 = open(r"F:\SEMESTER\python\ict.txt")
...: print (f1.read(5))
...:
ICT I
```

Example

The split() function splits the variable when space is encountered. You can also split using any characters as you wish.

```
with open(r"C:\Users\Mitesh\OneDrive\Desktop\ict.txt",'r') as file:
    data = file.readlines()
for line in data: word =
```

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology	
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python	

line.split() print (word)

Output:

```
In [7]:
...: with open(r"F:\SEMESTER\python\ict.txt",'r') as file:
...:     data = file.readlines()
...:     for line in data:
...:         word = line.split()
...:         print (word)
['ICT', 'ICT', 'ICT']
['ICT', 'ICT', 'ICT', 'ICT', 'ICT']
```

Working in Write Mode

The write() function is used to write in a file. The close() command terminates all the resources in use and frees the system of this particular program.

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

```
file = open("ict1.txt",'w')
file.write("ICT ICT ICT \n")
file.write("ICT ICT ICT ICT ICT")
file.close()
```

Using with() function

```
with open("file.txt", "w") as f:
    f.write("Hello World!!!")
f.close()
```

Working of Append Mode

Appending text to an existing file.

```
file = open("ict1.txt",'a') file.write("\n
Department Department") file.close()
Output:
```

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology	
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python	

Reading and Writing Binary Files

Reading and writing binary files, such as images. Rading files

with open(r'C:\Users\Mitesh\OneDrive\Desktop\a.tif', 'rb') as file:

binary_data = file.read() Output:

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

```
In [6]: with open(r'F:\SEMESTER\python\a.tif', 'rb') as file:
...:     binary_data = file.read()
...:     print(binary_data[:50])
b'MM\x00*\x00\x00\xfdh\x0b\x9c\x9f\x9e\x9b\x9e\x9c\x9f\x9e\x9d\x9e\x9e\x9f\xfe\xa8\x9e\xa3\xa1\xa2\xa0\xa4\xa0\xa5\xa3\xa1\xa3\xa1\xa4\xa5\xa2\xa1\xa5\xa5\xa4\xa6\xa5\xa4\xa6\xa7\xa5\xa5'
```

Writing binary files with

open('c.tif', 'wb') as f:

f.write(binary_data)

f.close() Output:

Working with CSV Files import

csv

Reading from a CSV file with

open('data.csv', 'r') as file:

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python

```
reader = csv.reader(file)
for row in reader:
    print(row) Output
```

:

```
In [12]:
...: import csv
...: with open("F:\SEMESTER\python\data-1.csv", 'r') as file:
...:     reader=csv.reader(file)
...:     for row in reader:
...:         print(row)
['sr ', 'M']
['1', 'a']
['2', 'b']
['3', 'c']
```

```
# Writing to a CSV file
import csv
```

```
with open('output.csv', 'w', newline='') as file:
```

```
    writer = csv.writer(file)
```

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

```
    writer.writerow(['Name', 'Subject', 'Mark'])
```

```
    writer.writerow(['Kenil', 'PWP', 10])
```

```
    writer.writerow(['Meet', 'PWP', 9])
```

```
    file.close()
```

```
ex-13.py* X  output.csv X
Name,Subject,Mark
Kenil,PWP,10
Meet,PWP,9
```

Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python	

Post Lab Exercise:

- Write a program that reads a text file example.txt and counts the number of lines, words, and characters in the file. Print these counts.

Code and Output:

```
In [4]: with open(r"C:\Users\Meet\OneDrive\Desktop\file1.txt", "r") as file:
...:     text = file.read()
...:
...:     lines = text.splitlines()
...:     words = text.split()
...:     characters = list(text)
...:
...:     print("Lines:", len(lines))
...:     print("Words:", len(words))
...:     print("Characters:", len(characters))
Lines: 1
Words: 2
Characters: 14
```

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

- Write a Python program to read a text file line by line and store each line in a list. Print the list after reading the entire file. Code and output:

 Marwadi University Marwadi Chandarana Group 	Marwadi University Faculty of Engineering & Technology Department of Information and Communication Technology	
Subject: Programming With Python (01CT1309)	Aim: Practical based on File Handling using Python	

```
In [5]: with open(r"C:\Users\Meet\OneDrive\Desktop\file1.txt", "r") as file:
...:     lines = file.readlines()
...:
...:     print(lines)
```

- c. Write a Python program to read data from a CSV file data.csv and print each row to the console. Code and output:

```
In [6]: import csv
...:
...: with open(r'C:\Users\Meet\Downloads\data-1.csv', mode='r', newline='') as file:
...:     reader = csv.reader(file)
...:     for row in reader:
...:         print(row)
['sr ', 'M']
['1', 'a']
['2', 'b']
['3', 'c']
```

Aim: Practical based on File Handling using Python

Python (01CT1309)

Experiment No: 13

Date:11-09-2025

Enrollment No: 92400133131

- d. Write a Python program that merges the contents of two text files file1.txt and file2.txt into a third file merged.txt. Ensure that the contents of file1.txt come first. Code and output:

```

1  # -*- coding: utf-8 -*-
2  """
3  Created on Thu Sep 11 20:42:04 2025
4
5  @author: Meet
6  """
7
8  with open(r"C:\Users\Meet\OneDrive\Desktop\file1.txt", "r") as file1:
9      data1 = file1.read()
10
11  with open(r"C:\Users\Meet\OneDrive\Desktop\file2.txt", "r") as file2:
12      data2 = file2.read()
13
14  with open("merged.txt", "w") as merged:
15      merged.write(data1)
16      merged.write(data2)

```
